

Name: Kristen Ramirez and Lacey Merced

Project Name: Week9_TextStarter_LoopsArrays

Part 1: We started with the Radiator Springs visitor guide project from previous weeks and continued organizing our work into folders, files, documentation, and testing. We updated the starter code, changed the menu choices, tested the program, and saved everything in our GitHub repository.

Part 2: Querying And Research

Question or Need: How arrays work

Where We Looked: Course guide and provided videos

What We Learned: Arrays store related values together.

How We Used It: We used an array to store the menu choices.

Question or Need: How loops work

Where We Looked: Week 9 starter code and video

What We Learned: Different loops have different jobs.

How We Used It: We used loops to display choices and repeat the program.

Question or Need: GitHub organization

Where We Looked: Course guide and YouTube videos on refresher on GitHub

What We Learned: How to organize files for submission.

How We Used It: We organized the repository and uploaded the required files.

Part 3: This project required both hard skills and soft skills. We used hard skills such as coding in Visual Basic, testing the program, organizing files in GitHub, and following documentation. We also used soft skills like communication, problem-solving, and collaboration to complete the assignment together. The project depended on machines and tools such as our computers, Visual Studio, and GitHub. We also relied on the course guide, starter code, videos, and each other to better understand the assignment and complete every part.

Part 4: Next time, we would organize our folders earlier, test the program sooner, and complete the documentation as we finish each section instead of waiting until the end.

Part 5: Week 9 Coding Practice

Pathway A: Text Starter Code

Array used:

The storyChoices array stores the menu choices the user can select.

Loop used to display choices:

The For...Next loop displays each menu choice from the array.

Loop used to repeat the program:

The Do While loop keeps the program running until the user chooses to exit.

Three choices we changed:

- Flo's to the North East
- Doc's Oil Changes across from Ramone's
- Visit the Cozy Cone

Pathway B: Video Tutorial

Project from the video:

I created a [VB.NET](#) program that uses a Do While loop to generate random numbers and display them in a list box when the user clicks the "Malik McQueen Loop" button.

Loop or loops used:

The program uses a Do While loop: Do While intRandomNum < 15

The loop continues generating random numbers between 0 and 24 and adds them to the list box until a number greater than or equal to 15 is generated.

My small personal change:

My personal change was renaming the Loop button to "Malik McQueen Loop." Malik McQueen is one of the characters we created and used in our projects from Weeks 6 and 7. This change personalized the program without changing its functionality.
